Python Programming Fundamentals Cheat Sheet

Package/Method	Description
AND	Returns 'True' if both statement1 and statement2 are 'True'. Otherwise, returns 'False'.
Class Definition	Defines a blueprint for creating objects and defining their attributes and behaviors.
Define Function	A `function` is a reusable block of code that performs a specific task or set of tasks when called.

Syntax and Code Example

```
Syntax:
```

- 1. 1
- statement1 and statement2

Copied!

```
Example:
```

- 1. 1
- 2. 2
- 3. 3
- 4. 4
- 5.5
- 6. 6 7. 7
- 8.8
- 9. 9

```
1. marks = 90
```

- 2. attendance_percentage = 87
- 3.
- 4. if marks >= 80 and attendance_percentage >= 85:
- 5. print("qualify for honors")
- 6. else:
- 7. print("Not qualified for honors")
- 9. # Output = qualify for honors

Copied!

Syntax:

- 1 1
- class ClassName: # Class attributes and methods

Copied!

Example:

- 1. 1
- 2. 2
- 3. 3
- 4. 4
- 1. class Person:
 - . def __init__(self, name, age):
- self.name = nameself.age = age

Copied!

Syntax:

- 1. 1
- 1. def function_name(parameters): # Function body

Copied!

Example:

1. 1

```
1. def greet(name): print("Hello,", name)
                                                                                                                                                         Copied!
                                                                                                                                                        Syntax:
                                                                                                                                                           1. 1
                                                                                                                                                           1. variable1 == variable2
                                                                                                                                                         Copied!
                                                                                                                                                        Example 1:
                                                                                                                                                           1. 1
                                                                                                                                                           1. 5 == 5
Equal(==)
                           Checks if two values are equal.
                                                                                                                                                         Copied!
                                                                                                                                                        returns True
                                                                                                                                                        Example 2:
                                                                                                                                                           1. 1
                                                                                                                                                           1. age = 25 age == 30
                                                                                                                                                         Copied!
                                                                                                                                                        returns False
                                                                                                                                                        Syntax:
                                                                                                                                                           1. 1
                                                                                                                                                           1. for variable in sequence: # Code to repeat
                                                                                                                                                         Copied!
                                                                                                                                                         Example 1:
                                                                                                                                                           1. 1
                                                                                                                                                           2. 2

    for num in range(1, 10):

                           A 'for' loop repeatedly executes a block of code for a specified number of iterations or over a sequence of elements (list, range, string,
                                                                                                                                                                  print(num)
For Loop
                           etc.).
                                                                                                                                                         Copied!
                                                                                                                                                         Example 2:
                                                                                                                                                           1. 1
                                                                                                                                                           2. 2
                                                                                                                                                           3. 3
                                                                                                                                                           1. fruits = ["apple", "banana", "orange", "grape", "kiwi"]
                                                                                                                                                           2. for fruit in fruits:
                                                                                                                                                           print(fruit)
                                                                                                                                                         Copied!
Function Call
                           A function call is the act of executing the code within the function using the provided arguments.
                                                                                                                                                        Syntax:
                                                                                                                                                           1. 1

    function_name(arguments)

                                                                                                                                                         Copied!
```

```
Example:
```

- 1. 1
- greet("Alice")

Copied!

Syntax:

- 1. 1
- 1. variable1 >= variable2

Copied!

Example 1:

- 1. 1
- 1. 5 >= 5 and 9 >= 5

Copied!

returns True

Example 2:

- 1. 1
- 2. 2
- 3.3
- 1. quantity = 105 2. minimum = 100
- 3. quantity >= minimum

Copied!

returns True

Syntax:

- 1. 1
- variable1 > variable2

Copied!

Example 1: 9 > 6

returns True

Example 2:

- 1. 1
- 2. 2 3. 3
- 1. age = 20 2. max_age = 25
- 3. age > max_age

Copied!

returns False

Syntax:

1. 1

Example: 1. 1 2. 2 1. if temperature > 30: print("It's a hot day!") Copied! Syntax: 1. 1 2. 2 3.3 4.4 5.5 6.6 7.7 8.8 1. if condition1: 2. # Code if condition1 is True 4. elif condition2: 5. # Code if condition2 is True 6. 7. else: 8. # Code if no condition is True Copied! Executes the first code block if condition1 is 'True', otherwise checks condition2, and so on. If no condition is 'True', the else block is If-Elif-Else Example: executed. 1. 1 2. 2 3.3 4.4 5.5 6.6 7. 7 8.8 9.9 1. score = 85 # Example score 2. if score >= 90: print("You got an A!") 4. elif score >= 80: 5. print("You got a B.") 6. else: 7. print("You need to work harder.") 9. # Output = You got a B. Copied! If-Else Statement Executes the first code block if the condition is 'True', otherwise the second block. Syntax: 1. 1 2. 2 1. if condition: # Code, if condition is True 2. else: # Code, if condition is False Copied! Example:

1. if condition: #code block for if statement

```
1. 1
2. 2
3. 3
4. 4

1. if age >= 18:
2.    print("You're an adult.")
3. else:
4.    print("You're not an adult yet.")

Copied!

Syntax:
```

1. 1

1. variable1 <= variable2</pre>

Copied!

```
Example 1:
```

1. 1

1. 5 <= 5 and 3 <= 5

Copied!

returns True

Example 2:

```
1. 1
```

2. 2

- -

1. size = 38

2. max_size = 40

3. size <= max_size</pre>

Copied!

returns True

Syntax:

1. 1

variable1 < variable2

Copied!

Example 1:

1. 1

1.4 < 6

Copied!

returns True

Example 2:

- 1. 1
- 2. 2
- 3.3

1. score = 60

'break' exits the loop prematurely. 'continue' skips the rest of the current iteration and moves to the next iteration.

NOT

Returns 'True' if variable is 'False', and vice versa.

2. passing_score = 65
3. score < passing_score</pre>

Copied!

returns True

Syntax:

- 1. 1
- 2. 2
- 3. 3 4. 4
- 5. 5
- 6.6
- 7. 7
- 1. for: # Code to repeat
- if # boolean statement
 break
- 3. 4.
- 5. for: # Code to repeat
- 6. if # boolean statement
- continue

Copied!

Example 1:

- 1. 1
- 2. 2 3. 3
- 4. 4
- for num in range(1, 6):
- 2. if num == 3:
- 3. break
- print(num)

Copied!

Example 2:

- 1. 1
- 2. 2
- 3.3
- 4. 4
- for num in range(1, 6):
- 2. if num == 3:
- continue
- print(num)

Copied!

Syntax:

- 1. 1
- 1. !variable

Copied!

Example:

- 1. 1
- !isLocked

Not Equal(!=) Checks if two values are not equal. Object Creation Creates an instance of a class (object) using the class constructor. OR Returns 'True' if either statement1 or statement2 (or both) are 'True'. Otherwise, returns 'False'. returns True if the variable is False (i.e., unlocked).

Syntax:

- 1. 1
- variable1 != variable2

Copied!

Example:

- 1. 1
- 2. 2
- 3. 3
- 1. a = 10
- 2. b = 20 3. a != b

Copied!

returns True

Example 2:

- 1. 1
- 2. 2
- 1. count=0
- 2. count != 0

Copied!

returns False

Syntax:

- 1. 1
- 1. object_name = ClassName(arguments)

Copied!

Example:

- 1. 1
- 1. person1 = Person("Alice", 25)

Copied!

Syntax:

- 1. 1
- 1. statement1 || statement2

Copied!

Example:

- 1. 1
- 2. 2
- 1. "Farewell Party Invitation"
- 2. Grade = 12 grade == 11 or grade == 12

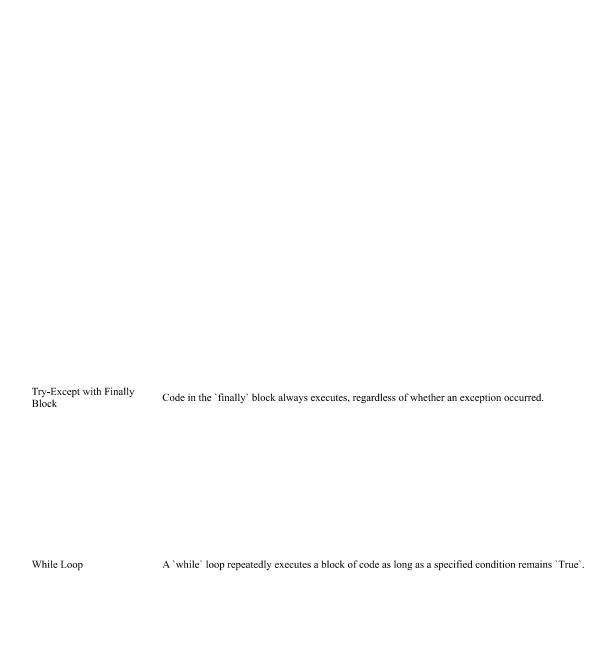

```
returns True
